**Introduction**

When a DPF is completely clean (for instance following regeneration), the penetration of soot through the DPF is significantly higher than when it is slightly loaded. It can be important to characterise the increase in soot filtration efficiency with sootload for a given part. If a part becomes damaged, the filtration of soot may also be impaired and it can be useful to define a ‘pass/fail’ criterion which can be based on soot filtration efficiency at a given soot load. This application note discusses these.

The Efficiency % may be defined as:

\[ \eta = 100 \times (1 - \frac{\text{Outlet}}{\text{Inlet}}) \]

(where **Inlet** is aerosol measurement at DPF inlet and **Outlet** is aerosol measurement at DPF outlet)

Penetration% is 100- efficiency %

A suitable aerosol measurement instrument (eg AVL415S) measuring up and downstream of a DPF can be used in conjunction with the loading test (described in dpg001v02) to determine the change in trapping efficiency of a part as it becomes loaded.

The stability of the soot generation rate from the burner means that a single instrument may be used to monitor the downstream soot – occasionally checking the upstream soot rate.

Typical characteristics for efficiency in terms of soot mass and particle number are shown in Figure 1. For Light duty DPFs (between 3 and 4 litre volume), the efficiency is >99% for 0.5g total soot load. For this reason, it may be convenient to reduce the soot loading rate at the start of load (eg from the standard setpoint of ~10g/hr to ~2 g/hr).

The ‘high transmission’ phase of the load is associated with the ‘pore filling’ load phase (see application note DPG 001 for details)

![Figure 1 Efficiency of (undamaged) DPF vs sootload measured with AVL415 (mass) and CPC TSI 3022 (number)](image-url)
Figure 2 shows the ‘penetration’ for two different filters from clean during identical ‘efficiency’ tests using the AVL415.

**Figure 2 Comparative loads for two different substrates**

The Appendix shows a standard report from an efficiency measurement soot load, together with penetration vs soot load calculated from the datafile.
Appendix

DPG Test Report

Test information
- Test date: 25-Jan-2008 14:28:44
- Part type: 2.4L
- Serial number: sample 1-2
- Operator: RB
- Test rig number: 1
- Schedule: DPF efficiency 240C
- Status:

Individual weighing results
- Unloaded weight: 1058.8
- Loaded weight: 1678.6

Weighing summary
- Target soot mass (g): 21.0
- Corrected soot mass (g): 19.8

Comments
- Pre test comments: 1-2 loaded to ~ 8g/litre
- Post test comments: ‘test complete

Terminal values
- Terminal backpressure (mbar): 110.8
- Terminal efficiency (%): 160.0

Alarms and warnings
- Start time
- End time
- Code
- Alarm
- Source
- Violation

Soot loading DP profile
